

7. Added Real-Time UI Audible Rendering

Overview

Because the backend now possesses the autonomy to change the play at the line of scrimmage, we needed a way to alert the user that the primary suggestion was mathematically vetoed.

Code Changes

- **Backend Payload:** Updated the Flask jsonify return statement to include an `is_audible`: True/False boolean flag alongside the visualization and EPA data.
- **Frontend Rendering:** Implemented conditional rendering in `result.js`. When the `is_audible` flag returns True, the UI mounts a visual "🚨 AUDIBLE CALLED AT THE LINE" badge, letting the user know the AI actively changed the play to avoid a negative EPA outcome.

Future Roadmap

We plan to introduce detailed "Audible Logs" in the UI. If the badge triggers, the user will be able to click it to see *why* the AI audibled (e.g., a modal popping up saying: "Primary Call: Inside Zone. Projected EPA: -1.2. Checked into: Quick Slant. New EPA: +0.4").
