

5. Engineered the "Coach's Override" Bypass

Overview

We transformed the application from a passive suggestion engine into an interactive "what-if" simulator. The "Coach's Override" allows the user to force a specific concept (Run or Pass) to see how the math stacks up against the AI's primary recommendation.

Code Changes

- **Frontend (React):** Appended `forced_play_type: editableData.actualPlayType` to the `currentSituation` JSON payload inside the `submitUpdatedSituation` function in `result.js`.
- **Backend (Flask):** Built a structural bypass lane in `app.py` (if `forced_play:`). If this variable is detected, Flask skips the `predict_play` Master Switch entirely, manually sets the prediction variable to the forced type, and routes it directly into the expected yards engines.

Future Roadmap

The current override is limited to broad "Run vs. Pass" categories. In the next iteration, we will expand this to allow the user to force specific *Run Gaps* (e.g., Force A-Gap Run) or *Pass Routes* (e.g., Force Post Route) to run highly granular comparative analysis against the defense.
